

# Supporting the sustainable management of forests

Wood floors are the most **environmentally friendly flooring** option available. Unlike other flooring materials, the raw materials used to make them – trees – can regrow after they are cut down, which replaces the material that is harvested.

Finfloor's FINOAK engineered wood flooring is carefully sourced and adheres to **EUTR conformity**.

The European Union Timber Regulation (EUTR) aims to counter illegal logging and associated trade in timber and timber products in the member states of the European Union, and ultimately contribute to sustainable management of forests and reduced emissions from deforestation and forest degradation beyond EU borders.

EUTR regulations stipulate that all imported timber products, must be from legal and sustainable sources. To prove this our manufactures supply trace documentation of the wood and can trace back the supply chain to the forest. There are random checks in Europe that enforce this and upon request we can request this documentation.

Both FINOAK HDF and Finoak 3-ply make **NO use of dangerous solvents** during the manufacturing process.

Benefitting you with the peace of mind knowing that

- Engineered timbers avoid the misuse and indiscriminate stripping of natural rain forests, due to the lesser usage of material used
- No harmful chemicals are bought into your home or workspace
- No toxic dangerous solvents are used in manufacture
- With a click system installation these floors can be Installed without the use of harmful glues
- Low VOC finishes and sealants are used
- A reduction in the amount of waste in our landfills
- The product is biodegradable, and if ends up in our landfill with decompose
- You are installing a carbon neutral product as wood continues to store carbon as a manufactured end-product
